

Food Ordering Behaviour & Consumer Trends Analysis Using Tableau — Data Preprocessing & Business Questions

Dataset Description:

The dataset contains 50,000 food delivery order records describing customer demographics, ordering context, and delivery outcomes. It includes fields such as order ID, user ID, customer age, city, order time, day type, cuisine, meal type, restaurant type, order value, discount applied, delivery fee, time taken to order, rating given, repeat-order status, mood, hunger level, company (who the order was placed with), and weather condition at the time of order. The dataset is used to analyze food ordering behaviour and consumer trends across Indian cities through Tableau dashboards and story points.

Data Preprocessing Steps:

- Imported the CSV dataset (food_ordering_behavior_dataset.csv) into Tableau.
- Verified column names and data types (order value, delivery fee, rating, and time fields set as numeric; city, cuisine, meal type, and company set as categorical).
- Removed duplicate records (none found).
- Checked for missing values (none found across all 19 columns).
- Converted fields into appropriate data types.
- Grouped customer age into age-group bins (Gen Z, Millennials, Adults, Children) for demographic analysis.
- Organized the dataset for visualization, including city, cuisine, meal type, and restaurant type hierarchies.
- Created calculated fields and worksheets for KPI, revenue, and delivery performance analysis.
- Built interactive filters for restaurant type, meal type, cuisine, and city.

Business Questions:

- What factors influence food ordering behaviour and order value?
- How do meal type and company (alone, family, friends, partner) affect ordering patterns?
- Which cities and cuisines drive the highest order volume and revenue?
- How do customer age groups and restaurant type influence ordering habits?
- How does meal type contribute to overall revenue?
- What does delivery time distribution reveal about delivery performance?

Visualizations:

3. Order Distribution by Age Group and Restaurant Segment

4. Distribution of Customer Preferences Across Cuisines

5. Analysis of Orders Across Company Type and Meal Type

6. Customer Rating Analysis by Meal Type

7. Cities by Order Volume

8. Revenue Contribution by Meal Type

9. Distribution of Delivery Time Across Orders
